

Tooldyne Reduced unbalance increases machining quality

Today, high-speed machining is the established procedure for the economic machining of metals and plastics. Due to new developments in cutting materials and spindles, the achievable cutting speeds are consistently increasing. However, this procedure does have its challenges: Early on in its development, it was recognized that the unbalance of spindles, specifically the tools, sets severe limits on high-speed machining. This unbalance has a substantial influence on the achieved

quality and precision of the surfaces to be machined. The spindle and tool longevity is also critically influenced by unbalance.

Whereas the unbalance of spindles and other drive components can be removed during manufacturing, tools must be balanced more frequently, usually prior to initial use in a machine tool.

Tooldyne The complete package for balancing tools

ducible tool seat.

Everything in its proper place

During the design of our new Tooldyne, ergonomics combined with easy operation were at the top of our specifications. The result of this is a compact solution in which everything is in its proper place: starting with the easy to operate protective cover through to the ideal working height, right up to the easily accessible storage container for the tool adaptor.

The measuring unit is clearly visible and allows you simple and direct input of all data via a touch screen. The logical operating concept with clear and easily understandable displays using symbols aligned to touch screen operation as well as a comprehensive range of operating aids will quickly make the Tooldyne a popular working device.

pneumatic clamping

Easy to operate and safe – the protective hood

Your safety comes first

The Tooldyne fulfils the requirements laid down in the latest Machinery Directive 2006/42/EC, valid since the beginning of 2010, in every respect, and is CE certified. The protective cap fulfils the high standards set by the ISO 7475 Class C - Protection against ejected parts.

We have also ensured that many other components are safe in that they cannot clamp fingers and that adjustments can be carried out almost entirely without tools. The function of each component is safe and easy to understand.

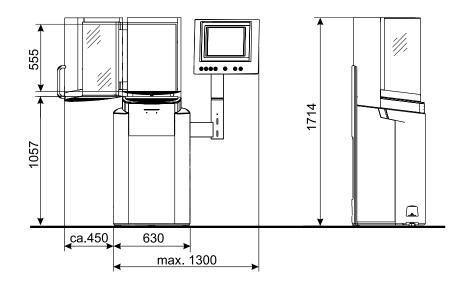

Mineral casting also permits a crane hook machine design. Simply set it up, align it and connect it to compressed air and power supplies and you can start balancing your tools – all this without foundations and without

having to bolt the machine to the floor.

Technical data

– Maximum rotor weight: 30 kg
– Max. tool diameter: 400 mm
– Max. tool length inc. adaptor: 600 mm
– Spindle speed: 1200 rpm
– Smallest achievable residual unbalance: 0.5 gmm/kg
- Dimensions (see drawing)
– Total weight: 670 kg
 Mains connection: 220V ± 10%, 50 / 60 Hz
- Compressed air: 6 bar
– Drive performance: 400 W
 Protective cover acc. ISO 7475 Class C (protection against ejected parts)
2-coloured painting RAL7035 (light grey), RAL 7024 (graphite grey)
- with touch screen operation
- Printer for protocol print-outs
- Typical tool adaptors e.g. for SK, HSK, BT, CAPTO
